Implementation of the Airbnb Database

Install MariaDB and run the files:

1. follow the download instructions on mariadb.org to download and install the appropriate format for your operating system.

After that, you should be in the client prompt after entering the password (which you set during installation). Which looks something like this:

Welcome to the MariaDB monitor. Commands end ....
....
MariasDB [(none)] > ;

[(none)] indicates that no database is in use.

By typing "MariasDB [(none)] > exit" you end the use of the client.

2. in your terminal, change to the directory where you saved the files Airbnb.sql and TestData_Airbnb.sql.

3. enter the following command to implement the database:
    mysql -uusername -p < AirbnbLuc.sql

4. if you want to import the test data then execute the following command:
    mysql -uusername -p Airbnb < TestData_Airbnb.sql

5. after loggin with "mysql -uusername -p " you can run the command:
    MariasDB [(none)] > USE Airbnb;
    to use the database.
